Instructions for Methacholine Challenge

The purpose of a methacholine challenge test is to determine the amount of airway irritability in your lungs. Your doctor may have ordered this test to determine if you have asthma. You will be asked to inhale a mist that contains different concentrations of methacholine. Methacholine is a substance that causes airway hyper-responsiveness similar to that seen in asthma. Simply, a device called a nebulizer machine produces a mist of methacholine which is inhaled through a mouthpiece. Methacholine is not given if you might be pregnant, nursing or are taking medication for Myasthenia Gravis, or have had a stroke or heart attack within the last 3 months.

Because some medications may alter the effects of the methacholine we ask that you <u>avoid taking ONLY</u> the following medications listed below (please continue all other meds as prescribed).

Please check with your prescribing physician before stopping any medication

<u>Please avoid these medications for **one week** prior to your test:</u>

Advair	Breo	Medrol	Qvar	Veramyst
